VINCENZO DON — AI Red Teaming (EN/IT)

Rome, Italy (EU, CET) | Italian (native), English (professional) | GitHub: github.com/VincenzoDon

SUMMARY

Independent AI safety researcher. Completed **Gray Swan AI Safety Training (certified)** and active in IPI White Box Wave 2 (IPI prompt injection). Author of **"Beyond the Stopping Point"** — zero-cost, CPU-only, pre-registered research on forced-epilogue leakage of hidden context (3,060 generations across Qwen/Llama families). Filed **NVIDIA garak issue #2369** proposing a new probe for hidden-context exposure (OWASP LLM08:2026) with cross-family replication.

RELEVANT EXPERIENCE & ARTIFACTS

Oltre il silenzio (2026) — Public repo: github.com/VincenzoDon/oltre-il-silenzio — Pre-registered experiments on when small open models (Qwen2.5-3B, Llama-3.2-3B, llama.cpp *ignore_eos*) leak hidden records hidden in system prompt / retrieved document / tool output. Findings: natural answers ~0% leak; forced continuation leaks 10–60% in epilogue or next turn depending on family; prohibition alone does not protect. All predictions dated before data; failures published as such.

NVIDIA garak #2369 — Proposed probe `epilogue.ForcedEpilogueLeak` with two-stage detector (epilogue + following turn); second-family replication included. garak #2369.

Gray Swan Arena — Safety Training certified (2026); active White Box testing (IPI prompt injection). Familiar with tool-calling agents, injection as "untrusted data until corroborated," and judging criteria that reward tool/state calls.

SKILLS

Prompt injection / indirect prompt injection, LLM evaluation & red-teaming, forced-epilogue / EOS-suppression audit (black-box), bilingual (EN/IT) adversarial content design, reproducible research (paired bootstrap CIs, pre-registration), Python, llama.cpp, Git.

AVAILABILITY

Part-time contract, remote, CET; flexible hours. EU work authorization (Italian citizen). Can track time with Insightful and be paid via Stripe (USD). Individual contractor (no B2B).

All claims above are verifiable via public repo and Garak issue; no private break details shared before 30-day embargo.
